TITLE: Insecticides of Organophosphorus Compounds - Some  
Derivatives of Methylthiophosphinic- and Methylthio-  
phosphinic Acids (Fosfororganicheskiye insektitsidy,  
nekotoryye proizvodnyye metiltiofosfinovoy i  
metilditiofosfinovoy kislot)

PERIODICAL: Zhurnal obshchey khimii, 1958, Vol. 28, Nr 6, pp.  
1568 - 1573 (USSR)

ABSTRACT: The majority of phosphorus organic insecticides are  
derivatives of thiophosphoric-, dithiophosphoric- and  
pyrophosphoric acids (Refs 1 - 3). In publications also a  
few insecticides are described which are derivatives of  
phosphinic- and dithiophosphinic acids; among them are the  
methylphosphinates and methylthiophosphinates. The latter  
contain substituted aryl groups (Ref 4), the ethylxanthoyl-  
group, as well as other groups (Refs 4,5) and the  
O-ethyl-O-p-nitrophenylester of phenylthiophosphinic acid  
("E.P.N.") (Ref 6). This ester is the only insecticide

Card 1/3

Derivatives of Methylthiophosphinic - and  
Methyldithiophosphinic Acids

SOV/79-28-6-30/63

of the series of thiophosphinic acids which is of practical importance. Therefore it was of interest to the authors to synthesize derivatives of alkylthio- and alkyl dithiophosphinic acids which have ester groupings analogous to those of well-known insecticides of thiophosphoric- and dithiophosphoric acid. The authors obtained from the dichloroanhydride of methylthiophosphinic acids the chloroanhydrides of the acid esters of methylthiophosphinic acid with methoxy-, ethoxy- and propoxy groups. Derivatives of methylthiophosphinic- and methyldithiophosphinic acid with groupings corresponding to well-known insecticides (Tioros, Metafos, Karbofos, Potazan and Sistoks) were synthesized. The insecticide properties of the synthesized compounds were investigated in the laboratory using the autumn bugs on the plant "Eurygaster intergriceps Put" as well as the fullgrown caterpillars on the plant "Pseudococcus maritimus Ehrh". The insecticide effect of the mentioned synthesized compounds did not correspond to the activity of the known insecticides

TITLE:

Organophosphorus Insecticides (Fosfororganicheskiye  
insektitsidy). Some Esteramides of the Acids of Phosphorus  
Containing  $\beta$ -Fluoro-ethyl Groups (Nekotoryye efiroamidy kislot  
fosfora, soderzhashchiye  $\beta$ -ftoretil'nyye gruppy)

PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol. 29, Nr 5,  
pp 1680-1683 (USSR)

ABSTRACT:

The compounds formed correspond to the formula type

The following compounds were produced: methyl- $\beta$ -fluoro-ethyl-  
chloro-phosphate (Ye-40), the corresponding ethyl-(Ye-41),  
isopropyl-(Ye-43), and isobutyl-(Ye-45) compounds. Di- $\beta$ -fluoro-  
diethyl-chloro-phosphate (Ye-21), methyl- $\beta$ -fluoro-ethyl-  
dimethyl-amidophosphate (Ye-44), the corresponding ethyl-  
(Ye-42), isopropyl-(Ye-45), and isobutyl-(Ye-47) compounds.  
 $\beta$ -fluoro-diethyl-dimethylamido-thionephosphate (Ye-53).

Card 1/2

Organophosphorus Insecticides. Some Esteramides of the Acids of Phosphorus Containing  $\beta$ -Fluoro-ethyl Groups SCV/79-29-5-50/75

The preparation is described; boiling temperature, refraction, density, and composition are presented in tables (Tables 1 and 2). The toxic properties were tested with *Pseudococcus maritimus* Ehr. and *Calliptamus italicus* L. The compounds produced have only a weak insecticidal effect. There are 3 tables and 2 Soviet references.

Title : On Tumor Development.

Orig Pub : Vopr. onkologii, 1957, 3, No 2, 131-139

Abstract : Tumors are labile disease entities. They are capable of undergoing biologic and structural and, hence, clinical changes. The author suggests that this phenomenon be called the tumor "progression", including its development and changeability. The progression is analyzed from the standpoint of growth rates, reactions to outside stimuli, the fact which, essentially, characterizes the degree of its autonomy and the structural type of the tumor. In experimental oncology the progression is exemplified by cancer of the skin and breast in mice. The rate of growth of the breast tumors is greater

than normal during pregnancy. This lability depends upon the tumor's capability of transition from a "dependent" growth to an "independent" one. The differentiated final stage can be morphologically different from the initial stage which is characteristic of the organ concerned. In human oncology the benign tumors of the cervix and the prostate are transformed into malignant forms.

AUTHOR: Gamrat-Kurek, L.

TITLE: Quantitative evaluation of the efficiency in concentrating the production of the machine-building industry

PERIODICAL: Akademiya nauk Latvyskoy SSR. Izvestiya, no. 8 (181), 1962, 33-43

TEXT: Attempts were made to investigate several factors which play an important role in industrial and economic expansion. Special attention was paid to those resulting from concentration of production output. The author uses exponential relations to derive the following exponential indices:  $E_2 = E_1(N_1/N_2)^x$ , where  $E_1$  and  $E_2$  represent the expenditure of work required for production:  $H_{M2} = H_{M1}(N_1/N_2)^y$ , where  $H_{M1}$  and  $H_{M2}$  are the material costs; and  $C_2 = C_1(N_1/N_2)^z$ , where  $C_1$  and  $C_2$  are the prime costs;  $N_1$  and  $N_2$  designate the annual volume of production. The exponential indices  $x$ ,  $y$ , and  $z$  are used to indicate the following trends

Card 1/4

Quantitative evaluation of the ...

S/197/62/000/008/001/003  
B117/B186

of technical progress achieved:  $x$  denotes that part of it which is associated with reduced expenditure of work per production unit;  $y$  represents progress associated with reduced material costs;  $z$  indicates progress associated with reduced prime costs; subscript 1 refers to data known from the base plant while subscript 2 represents a new plant for which values are sought. On the basis of various items (12 products of the metalworking industry and 35 products of the machine-building industry) the following values were calculated:  $x \geq 0.2$ ,  $y = 0.05 - 0.15$ ,  $z = 0.25$  (for machine tools). It is emphasized that standard rates of wages (labor costs) and indirect costs have to be considered too. Expansion of production volume requires additional investment which, according to recommendations made in "Metodiki opredeleniya godovogo ekonomicheskogo effekta, poluchayemogo v rezul'tate vnedreniya novoy tekhniki" ("Methods of determining the annual economic gain resulting from the introduction of new technologies") Moscow, 1961, p. 6), is expressed by the following relation:  $E_{tot} = [(C_1 - C_2) - (1/T)Kd]N_2$ , where  $E_{tot}$  stands for the total economy;  $T$  is the "normative" redemption period for capital investment;  $1/T$  is the "normative" coefficient for the relative gain of capital investment; and  $Kd$  is the accrued investment added to the

basic and return funds per unit of annual production output. In "Metodika opredeleniya ekonomicheskoy effektivnosti vnedreniya mekhanizatsii i avtomatizatsii proizvodstva". ("Method of determining economic gains resulting from the introduction of mechanization and automation in production") Moscow, 1960, p. 21); it is recommended by the appropriate authority - namely Gosplan SSSR, Akademiya nauk SSSR (Gosplan USSR, Academy of Sciences USSR) - that the maximum redemption period (T) should be 1.5 - 6 years, depending on the manner and extent that production is modernized (internal mechanization to complete automation). A great variety of published data, including such publications as "Organizatsiya i planirovaniye samoletostroitel'nykh predpriyatiy" ("Organization and Planning of Aircraft Manufacturing Enterprises") Oborongiz, 1957, p. 442), as well as data from All-Union and Latvian plants and institutes, are evaluated in order to approach the problem in 8 different ways and to arrive finally at concrete examples. Such an example is the projected output of 500,000 (N<sub>2</sub>) M10 (M10) tapping tools, whose redemption period is put at 3 years (T); hence  $K_d = (0.3 - 0.086) \cdot 3 = 0.64$  roubles/tap per annular output production, resulting in  $0.64 \cdot 500,000 = 320,000$  roubles, which will be the upper limit of capital

investment. The economic gain should result in a 1.67-fold reduction of material costs in a 6.3-fold reduction of labor costs and in a 3.5 reduction of prime costs, as compared with economic production quota and with data of a presently operating plant. There are 2 figures and 3 tables.

TITLE: Short Reports (4) (Korotkiye scobshoheniya)

PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 23, Nr 11, pp. 1394-1394 (USSR)

ABSTRACT: The author reports that by the laboratory of the shipbuilding yard imeni Kirov at Astrakhan a new practice was introduced for the purpose of producing lead foils of a thickness of 0.1-0.2 mm, of which there was a shortage, from existing lead foils of 1 mm thickness by means of a lathe. For this purpose 2 steel rollers of 200 mm length and 90 mm diameter were used, which were mounted in an ordinary lathe in such a manner that the "carrying" roller was mounted in the working axis of the lathe and the second was fixed in provisional brackets with roller bearings on the body of the lathe. The author says that it was possible to attain the necessary parallelity of the two axes of the rollers, so that the foil was prevented from being pressed out at the side.

Of 21 cases of cancer, increased leukergy was present in 20 cases after intradermal injection of an aqueous extract obtained from cancer tissue of a homologous organ. In 2 other cases provocation by an extract from cancer of a heterogenous organ gave negative results. The test was negative in 13 healthy individuals. It is assumed that the increased leukergy in the 1st group depended on the focal reaction in the neoplastic tissue provoked by the injection of the specific antigen. Gibinski - Bytom

554. GAMSKI M. II Klin. Chor. Wewn., A.M., Wrocław; Inst. Immunol. i Ter. Doświadczeń. P.A.N. im L. Hirszfelda, Wrocław; I Klin. Chor. Wewn., A.M. Lublin. \* Wpływ preparatu D<sub>1</sub> - Nowego leku neutropowego na gospodarkę węglowodanową u chorych nerwicznych i cukrzycowych. Influence of preparation D<sub>1</sub> - the new neutropic drug - on the carbohydrate metabolism of neurotic and diabetic patients POL. ARCH. WEWNĘT. 1956, 26/7 (1079-1090) Graphs 11

The investigations concern the influence of 5-allylo-5-hydroxy-γ-iodopropyl-barbituric acid (preparation D<sub>1</sub>) on the carbohydrate metabolism. The preparation D<sub>1</sub>, produced on the author's initiative by prof. Bobrański, has a therapeutic influence on the central disorders of the vegetative regulations. Forty-one patients were examined in 2 groups, namely: group I: 32 neurotic patients treated with D<sub>1</sub> preparation. In 12 patients there was normalization of abnormal glucose tolerance curve, in 4 patients elevation and lengthening of that curve; in the remaining patients the picture was unchanged. A beneficial therapeutic effect in 1 woman with essential hypoglycaemia on the ground of vegetative disorders is worth especial attention. Group II: 9 diabetic patients. In the course of the treatment with D<sub>1</sub> preparation in 4 patients a distinct and long-lasting improvement of carbohydrate metabolism was seen; in 4 a similar transient effect was obtained, and in 1 patient no effect whatsoever. It is possible that the D<sub>1</sub> preparation removing the vegetative regulation disorders may be used as an auxiliary factor in the treatment of diabetes, especially in the cases in which the central component of the disorders is manifested distinctly. We must also reckon with a beneficial influence of the drug in essential hypoglycaemia on the basis of vegetative disorders.

EXCERPTA MEDICA Sec 16 Vol 7/9 Cancer Sept 59

3710. Recent investigations on leukergy in patients with malignant tumours after provocation with neoplastic antigen Obecny stan badań nad zachowaniem się leukergii u chorych z nowotworami złośliwymi po prowokacji antygenem nowotworowym. GAMSKI M. I. Klin. Chor. Wewn. A.M., Lublin, Nowotwory 1958, 8/3-4 (231-236) Tables 1

The course of leukergy after intracutaneous injection of a watery extract of neoplastic tissue was studied in 142 patients with newgrowths and in 45 healthy people. After injection of the extract from the analogous tumour, in 45 out of 51 patients with cancer of internal organs, in 10 out of 15 with cancer of the uterus, and in 3 out of 10 with cancer of the breast, positive reactions were obtained, i.e. increase of the degree of leukergy. In 44 out of 47 neoplastic patients who had been injected with an extract of a tumour of an organ other than the one diagnosed clinically, the reaction was negative. A similar test in 16 cancer patients with an extract of malignant granuloma gave a negative result, and in 3 patients with tumours of the lymphatic system it gave a positive result. In the control group, out of 45 persons examined, in only 1 was a positive reaction obtained after the injection of a neoplastic extract.

"Clinical Observations on the D<sub>1</sub>H Preparation in Treatment of Neuroses."

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 10, 4 Mar 63, pp 339-343.

Abstract: [Author's English summary] D<sub>1</sub>H, 5-allyl-5-hydroxypropyl barbituric acid, was produced in 1956 by Bobranski and co-workers which included the author. First clinical observations of its effects for 1956-1960 were previously reported by the author. The present observations concern D<sub>1</sub>H treatment of 125 cases, with long-lasting effect achieved in 100. No complications or side effects noted. 26 references, one in French, two in German, the rest in Polish.
